

## Medical Technology is responsible for human's life expectancy. Is it curse or a blessing to the society as a whole?

Admittedly, people have divergent outlooks regarding life expectancy. Some people espouse that longer life expectancy is pondered as a symbol of better life and prosperity, while others opine that this trend have demerits as well. This essay will discuss both sides of the spectrum and will reach to a plausible conclusion.

Needless to say, an imperative viewpoint in favour of life expectancy is that people who live longer gets an opportunity to fulfil their wishes. What is more, they will be able to serve the society with their experience and wisdom. To quote an instance, grandparents can inculcate benevolent values to their grand-children. Eventually, it helps in reducing the rate of juvenile delinquency.

On the downside, opponents do not agree with the aforementioned statements and believe that aged people may require care so families and government need to spend hefty amount of money on health care and insurance of these people. On top of it, unemployment rate surged because of over population of seniors. To exemplify in my knowledge it can be stated that youngsters will never get job if existing people are on work. Ergo, upsurge in demographic graph will result in faster depletion of natural resources and it would harm the economy due to which taxes rise.

Summing it up, even though longevity is a fortune but it has some negative impacts on economy and environment. Therefore, government and communities can do a plethora of things to deal with this situation.
